Wilderness Survival System: Design Diagrams

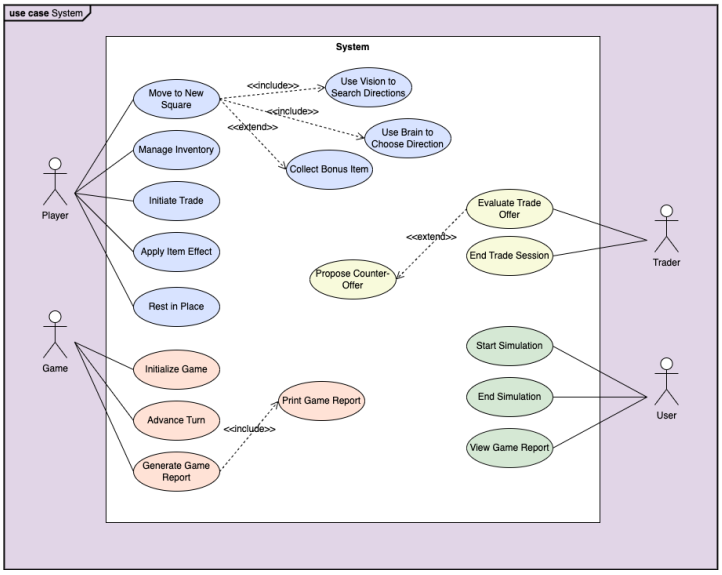

State Diagrams

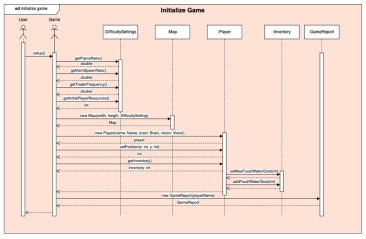

Use Cases

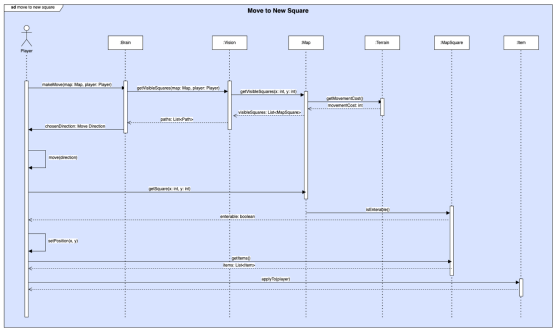

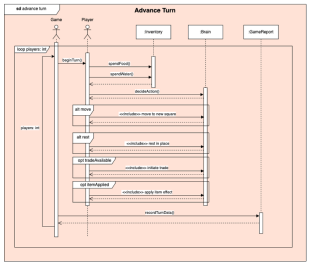

Background
Player 1. Move to a New Square: player moves one step to a neighboring square (N, S, E, W, or diagonal) - Uses Vision to search for desirable destinations - Uses Brain to evaluate options and choose a direction. 2. Rest in Place: Player chooses to remain on the current square to regain strength. 3. Collect Bonus Item: after moving to a square, the player collects any bonus items (food, water, gold) present. 4. Initiate Trade: Initiates trade negotiation with a Trader on the current square. 5. Monitor and Manage Inventory: Internally used by player to track, evaluate, and adjust resource levels Trader 1. Evaluate Trade Offer: Responds to a player's trade offer by either accepting, rejecting, or issuing a counter-offer. 2. Propose Counter-Offer: Trader declines the player's offer and proposes a new trade. 3. End Trade Session: Trader ends the session, refusing to continue negotiation. Game 1. Initialize Game: Initializes the WSS game session based on user inputs. 2. Advance Turn: Advances the game simulation by one turn for all players. 3. End Game: Ends the simulation once all players have finished or failed 4. Print Report: Prints summary results after the simulation User 1. Configure Game Settings: Provides configuration details to set up the game before it begins. 2. Start Simulation: Triggers the simulation after setup is complete. 3. View Game Report: Views the final report after the simulation ends.

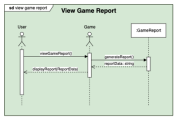

Use Case
Use Case Diagrams: external interactions from players perspective -- shows actors and their interactions with multiple system features. High Overview: only high-level interactions (overall). Sequence + Activity + State Diagrams: break down the use cases.
